

1. How to Setup the S3 Video Card for a Digital 500au Workstation

The file which tells the system how to set the video card is `DECW$PRIVATE_SERVER_SETUP.COM`

.... it is located in the system logical directory `SYS$MANAGER:`

Three lines must appear in this file for proper operation of the system graphics. The lines should appear in the "**Cluster Member Workstation-Specific Setup**" command group of the file, and appear after the `$do_default:` header.

Example:

```
$do_default:
$ decw$xsize_in_pixels == 1280
$ decw$ysize_in_pixels == 1024
$ define/system decw$server_refresh_rate 70
$ exit
```

If a `VMSinstal`, and or a `sysgen` procedure is run, the file may be replaced, and the new file will either require that you add these lines to it, or, locate the old file which will have been re-named as `decw$private_server_setup.old` and name it back...

As a backup measure, a copy of the command file should be located in

```
[xxx.COMMAND] as DECW$PRIVATE_SERVER_SETUP.COM_BACKUP
```
